

Readme For HW1

setup and run the program

Just download the student_id.csv data and read it in your program and compile it

explain for the program

First, make a list for specific station_ids that we want
and then filter all unexpected data(WDSD == -99 or -999).

Second, search for specific station_id by using for loop and get the WDSD range of each specific station.

Final, add each result of each station to the output list and print the list out.
